From: PyPI Security
To: #XXXXXX#

Thank you for your report.

There is no malicious behavior identified with this code yet.
There is no `encrypt.py` file included, and the way the code is structured it will show the user an error when trying to install.

If you have other indicators, please provide them.

Your reports lack context, which I have noted before, which makes reviewing them more difficult.

Hello,

First, this is yet another notice about duplicate reports for the same package - please keep your reports to a single instance, as it places extra burden on our review process.

Secondly, there's nothing I can see that is malicious about this package, all it does is print some details. As such, this report is invalid.

Subject: New reasoning models: OpenAI o1-preview and o1-mini
Date: Friday, September 13, 2024 at 03:18:06 China Standard Time
From: OpenAI
To: #XXXXXX#

OpenAI Logo

Hi there,

Today we announced our new series of models, OpenAI o1. We've developed these models to spend more time thinking before they respond. They can reason through complex tasks and solve harder problems than previous models in science, coding, and math. Read more in our blog post.

You can try the o1 beta in ChatGPT Plus. We're rolling out two models:

- Our larger model, o1-preview, which has strong reasoning capabilities and broad world knowledge.
- Our smaller model, o1-mini, which is faster and is competitive with o1-preview at coding tasks (you can see how it performs here).

These models aren't available in the API for your account while we're in this short beta period. (Developers on usage tier 5 will have access, but we'll expand access to more tiers.) We're continuing to improve o1 and we'll be in touch as soon as it's available to you in the API.

Best,
The OpenAI team

OpenAI, 1960 Bryant Street, San Francisco, CA 94110

Hello,

Thank you for your report.

Please be reminded that we do not require a separate report for each release of a project, unless there are material differences in the releases. This adds undue burden to our response.

Also, as previously mentioned in another response, please include some extra information on why you think these lines of code are malicious in nature.

Specifically for this project, and others from this user:

Can you provide more details as to why this is malicious in nature? It appears that the project does what it describes, which

is downloads other tools and places them in locations for the end user to execute.

Subject: yandex-related placeholder projects
Date: Wednesday, August 7, 2024 at 03:24:16 China Standard Time
From: PyPI Security
To: #XXXXXX#

Hello,

I wanted to reach out and respond to recent reports for projects owned by the `yandex-bot` PyPI user account.

These are indeed placeholder packages, and as such, we will handle them out of band for malware reporting. These are not malware, so please avoid further reports for projects that look exactly like these - as it increases the overall support burden

If you have specific indicators of projects that do contain malicious behavior, please report those regardless of the user account owning them.

Hello,

Please avoid multiple reports for the same project unless there are material differences in the indicators.

This report does not have sufficient details showing malicious behavior - respond to this message with more details as to the problematic code,.

Dear PyPI Security Team,
I hope this message finds you well. I am writing to inform you about a critical security issue that our team has detected using our proprietary PyPI malicious package detection tool.
On June 16, 2024, between 21:59 and 22:29 Beijing time, we identified a large-scale typosquatting attack on the PyPI repository. During this 30-minute window, 160 malicious packages were uploaded. These packages share the following characteristics:

- **Version Number**: All malicious packages have the version number 1.0.0.
- **Malicious Code Location**: The malicious code is embedded in the `setup.py` file of each package.
- **Malicious Code Example**:
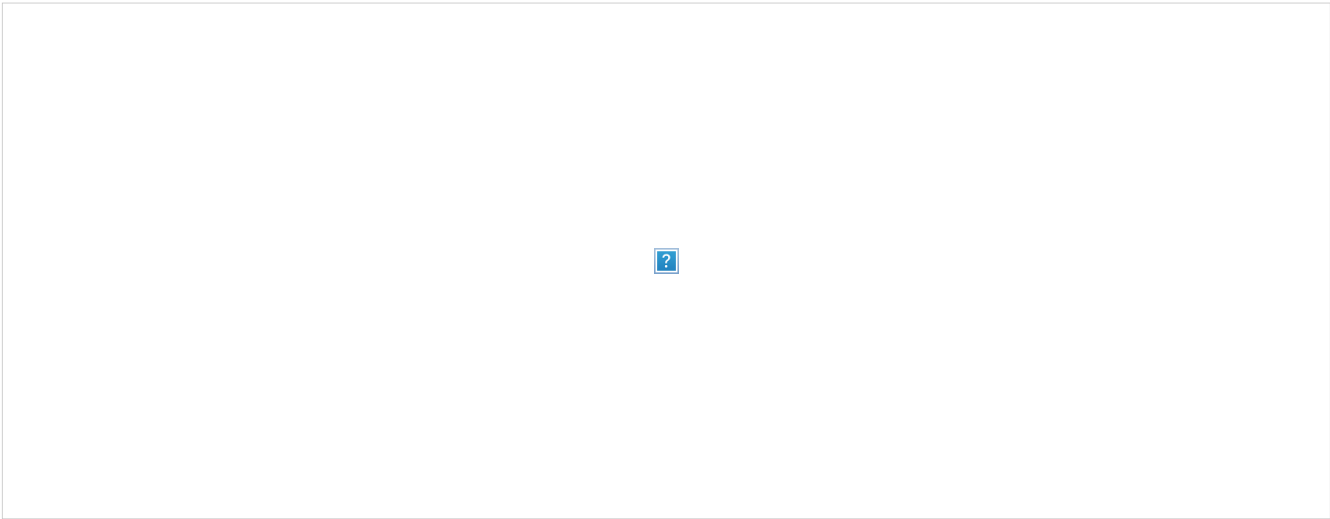

The malicious code is designed to decrypt and execute malicious content using `Fernet`. Specifically, it:

1. Imports the `requests` module.
2. Downloads malicious content from a specified URL.
3. Executes the downloaded content.

The attackers are using typosquatting techniques to automate the creation and upload of numerous malicious packages to PyPI.org. This type of attack poses a significant threat to the supply chain, potentially leading users to unknowingly install and execute malicious code.
For your reference, we have attached an Excel file containing a list of all detected malicious packages.
We urgently request that the PyPI security team take immediate action to remove these malicious packages and enhance security measures to prevent such incidents in the future. Ensuring the safety of the PyPI ecosystem and maintaining user

trust is crucial for the entire open-source community.
Thank you for your attention to this urgent matter. Please feel free to contact us if you need further information or assistance.
Sincerely,

Wenbo
Nanyang Technological University (NTU) Cyber Security Lab
